

This LM is to install the nginx on the ec2.

1. Add userdata in the ec2-instance module

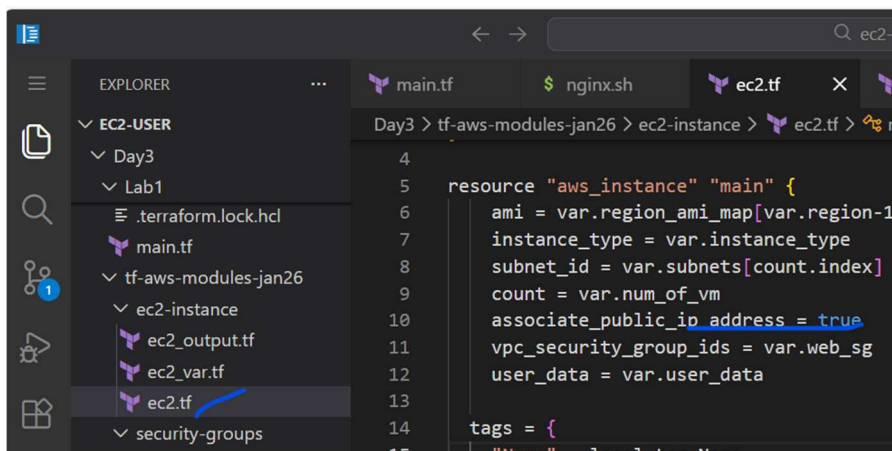

```
Day3 > tf-aws-modules-jan26 > ec2-instance > ec2.tf > resource "aws_instance" "main" {
4
5   resource "aws_instance" "main" {
6     ami = var.region_ami_map[var.region-1]
7     instance_type = var.instance_type
8     subnet_id = var.subnets[count.index]
9     count = var.num_of_vm
10    associate_public_ip_address = true
11    vpc_security_group_ids = var.web_sg
12    user_data = var.user_data
13
14    tags = {
15      "Name" = local.tag_Name
```

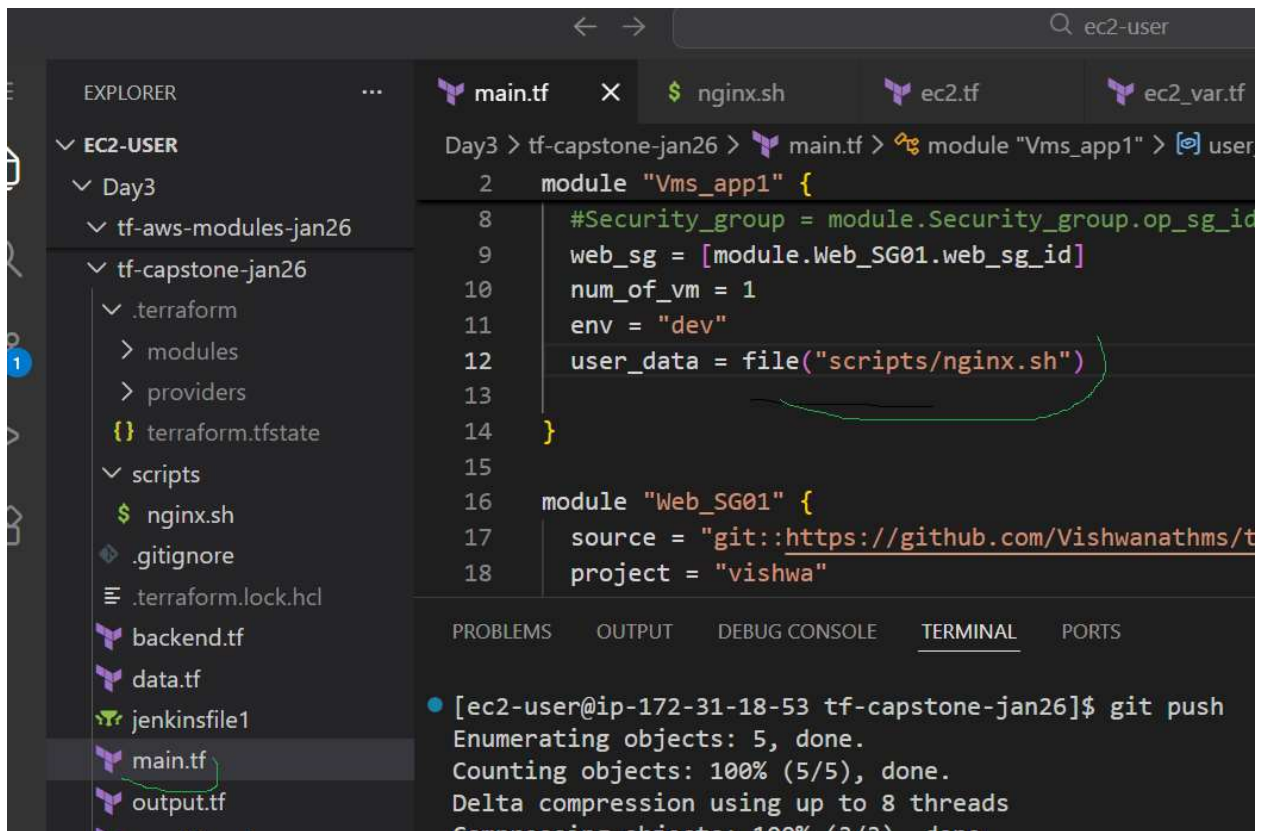

```
Day3 > tf-aws-modules-jan26 > ec2-instance > ec2_var
25   variable "region_ami_map" {
31   }
32
33   variable "web_sg" {
34     type = list
35   }
36
37   variable "user_data" {}
```

2. Enabled public ip in the ec2-instance module

```
Day3 > tf-aws-modules-jan26 > ec2-instance > ec2.tf > resource "aws_instance" "main" {
4
5   resource "aws_instance" "main" {
6     ami = var.region_ami_map[var.region-1]
7     instance_type = var.instance_type
8     subnet_id = var.subnets[count.index]
9     count = var.num_of_vm
10    associate_public_ip_address = true
11    vpc_security_group_ids = var.web_sg
12    user_data = var.user_data
13
14    tags = {
15      "Name" = local.tag_Name
```

3. Add userdata value in the main.tf

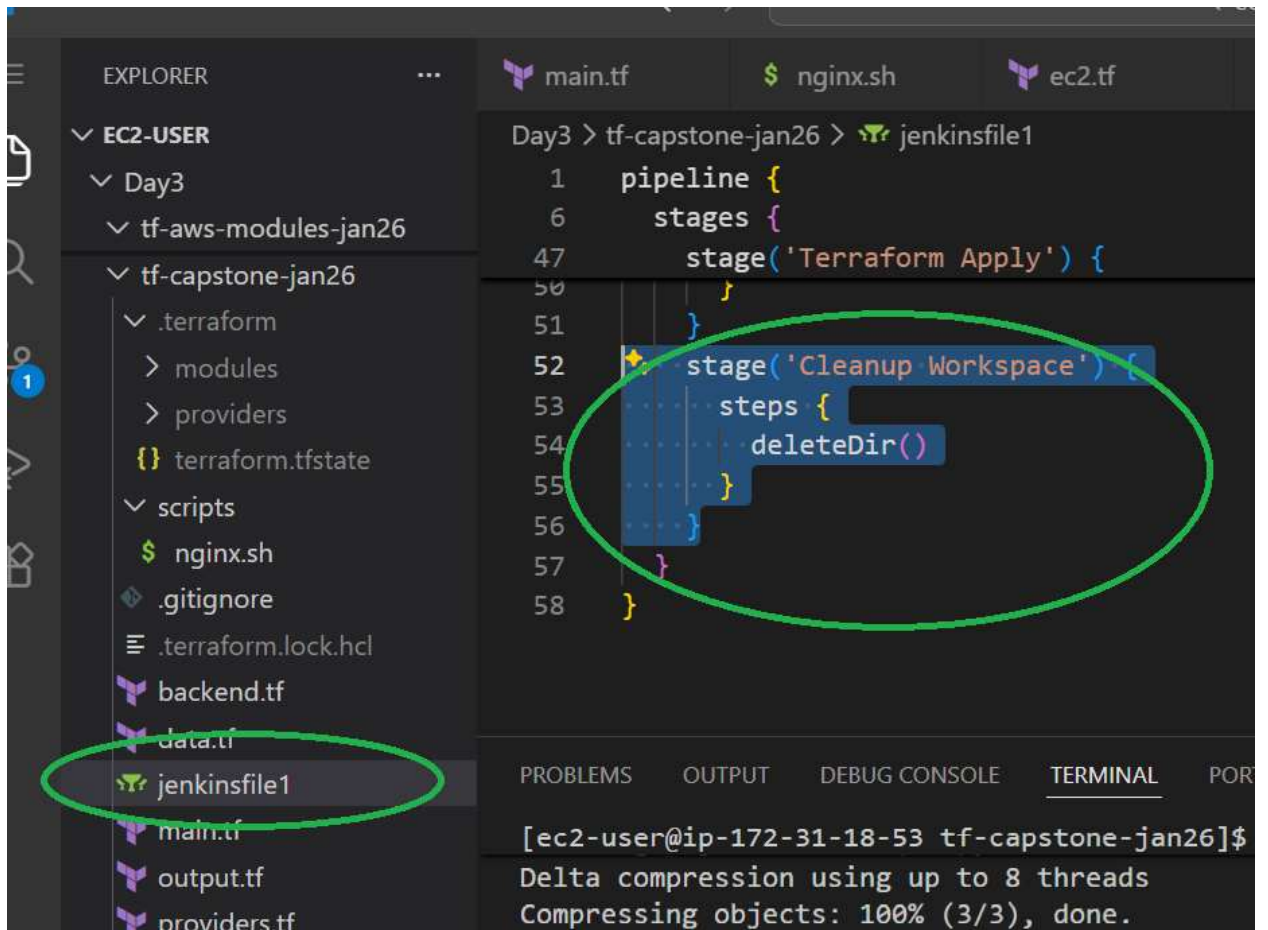

4. Add the script

In the capstone project folder

Scripts/nginx.sh

```
#!/bin/bash
dnf update -y
dnf install -y nginx
systemctl enable nginx
systemctl start nginx
```

5. Jenkinsfile data

```
stage('Cleanup Workspace') {  
    steps {  
        deleteDir()  
    }  
}
```

6. Delete the .module in the .terraform in the capstone repo
7. Terraform init
8. Terraform destroy locally
9. Push the code , Jenkins to pick up automatically to apply
